OS MARPAT 115:275222

AB The title membranes have a porous **membrane** structure with a pore size distribution such that the **membrane** does not permeate $\geq 90\%$ of particles of $0.5 \mu\text{m}$ size when the **membrane** is 0.1 mm **thick**. It is composed of a material having a N-containing compound and is liquid-permeable to **adsorb** and retain phosphopolyols (**nucleic** acids, lipopolysaccharides, glycerol phosphates, etc.). The membranes are especially useful for removal of pyrogens from a liquid. Thus, poly(vinyl alc.) hollow fiber membranes were epoxidized with epichlorohydrin, then treated with hexamethylenediamine. The resulting **membrane** was used to remove Escherichia coli-derived pyrogens from untreated water. When the amount of permeated liquid was 22 mL (of a 42 mL sample), the pyrogen removal was 99.99%. Preparation of other membranes [e.g. a histidine-containing poly(vinyl alc.) **membrane**] is described, as is pyrogen removal from physiol. saline, a cytochrome c solution, and a solution of human serum albumin.
